

## Our Contribution to the Sustainable Development Goals of the United Nations

The 17 Sustainable Development Goals (SDGs) were adopted in 2015 by the member states of the United Nations.

They set a road map for the sustainable social, economic and environmental transformation of our world by 2030.

The SDGs also offer us as a company a framework for contributing to a positive future for the world. Our ESG strategy is our contribution to tackling the greatest worldwide challenges, especially to achieving the following SDGs:

We respect diversity, a fair pay and participation structure and the individual promotion of our team members, thus contributing to equality of opportunity.

Economic success and a profitable investment strategy are for us the foundation for securing attractive jobs in the long term and contributing to healthy economic growth.

We promote a low-emission infrastructure by locating our properties close to existing residential areas, offering our tenants access to public transport. We modernise and reposition old industrial and commercial properties to make their use lower in emissions, cleaner and more flexible, thus making a noticeable contribution to sustainable industry.

When building and repairing our properties, we are careful to use innovative and energy-efficient systems so as to avoid unnecessary environmental pressures on the surrounding area. Wherever compatible with legislation and the comfort demands of our users, we reduce technical equipment to a minimum to promote the longevity of our properties.

We align both our company and our property projects to ESG criteria. This includes planning our properties in a way that is sparing of resources and ensures them a long useful life with maximum flexibility. We also maintain open interactions in the spirit of partnership with all those involved - from planners and building firms through to the eventual user.

Reducing emissions, especially CO<sub>2</sub> emissions, has a high priority for us within our ESG strategy. We as a company aim to reduce and compensate for our CO<sub>2</sub> footprint to make the most effective contribution we can to protecting the climate.
